The information on ISO 3166-2:1998 Codes for the representation of names of countries and their subdivisions - Part 2: Country subdivisions of all countries listed
in ISO 3166-1. The code elements used consist of the Antananarivo province in Madagascar It needs to be noted that the
characters after the separator are only unique within the subdivision list of one particular country. They can be (and in fact sometimes are) reused in the list of subdivision names of other countries e. g. ID-RI (Riau province of Indonesia) and NG-RI (Rivers province in Nigeria). So only a complete code element i. e. with the alpha-2 country code in
front guarantees uniqueness. The part of the code element given after the separator has usually been obtained from national sources and stems from coding systems already in use in the country concerned. For example: The subdivision code elements of France in ISO 3166-2 are the ones used on the car licence plates. Here FR-75 represents the
 Metropolitan Department Paris. The use of such well-known national systems in ISO 3166-2 certainly facilitates the acceptance of the International Standard. The names of the subdivisions are given in more than one language if the country has more than one official language (and the alternative language versions were available to ISO). In
Uzbekistan for example there are the official languages. The romanization systems that were used for converting the country subdivision list from a non-roman script to roman 
abbreviations and language codes (ISO 639) used in the header preceding the subdivision list of each country are explained in annexes to the standard. Sample entry for Canada from ISO 3166-2. The abbreviations used in the headers of the entries are explained in annexes to the standard.

Northwest Territories Territories Territories du Nord-Ouest CA-NU Nunavut CA-YT Yukon Territories du Yukon Relationship with other coding systems The subdivision standard provides an important link between ISO 3166-1 and UN/LOCODE, the United Nations
Economic Commission for Europe (UN/ECE). Whereas ISO 3166-1 codes country names, UN/LOCODE provides code elements for more than 32 000 names of ports, airports, rail and road terminals, postal exchange offices, border crossing points and other locations used in trade and transport. All code elements in UN/LOCODE start with the ISO
3166-1 alpha-2 country code element for the country in which the place concerned is located. In some countries there are several places with the same name. In such cases the relevant ISO 3166-2 subdivision code is essential to distinguish between them. All three code systems taken together enable users to consistently code geographical
information all the way down from the country level, over the subdivision level to the level of single locations used in trade and transport (see the short list below). ISO 3166-1 alpha-2 country code: DE (Germany) ISO 3166-2 subdivision code: DE (Germany) ISO 3166-1 alpha-2 country level, over the subdivision level to the level of single locations used in trade and transport (see the short list below). ISO 3166-1 alpha-2 country level, over the subdivision level to the level of single locations used in trade and transport (see the short list below). ISO 3166-1 alpha-2 country level, over the subdivision level to the level of single locations used in trade and transport (see the short list below). ISO 3166-1 alpha-2 country level, over the subdivision level to the level of single location level to the lev
Development of ISO 3166-2 The demand for a universally applicable coded representation of the country code came into use after its publication in 1974. Serious work on the subdivision project started in the 1980s. However, partly due to the
large amount of work involved in determining the correct (and ever-changing) lists of subdivisions of more than 230 countries on the late 1980s and early 1990s a complete country subdivision list became available only in 1997 when the draft International
 Standard was first put to the vote and was subsequently adopted. ISO 3166-2 ISO 3166-2 in 1998. Updates on ISO 3166-2 in 199

how you use the material. ISO standard country subdivision codes ISO 3166-2 is part of the ISO 3166-1. The official name of the standard is Codes for identifying the principal subdivisions (e.g., provinces or states) of all countries coded in ISO 3166-1. The official name of the standard is Codes for
the representation of names of countries and their subdivisions - Part 2: Country subdivision code. It was first published in 1998. The purpose of ISO 3166-2 is to establish an international standard of short and unique alphanumeric codes to represent the relevant administrative divisions and dependent territories of all countries in a more convenient
and less ambiguous form than their full names. Each complete ISO 3166-2 code consists of two parts, separated by a hyphen:[1] The first part is the ISO 3166-1 alpha-2 code of the country; The second part is a string of up to three alphanumeric characters, which is usually obtained from national sources and stems from coding systems already in use
in the country concerned, but may also be developed by the ISO 3166-2 code can then be used to uniquely identify a country subdivision in a global context. As of 23 November 2023[update] there are 5,046 codes defined in ISO 3166-2. For some countries, codes are defined for more than one level of subdivisions. The
following table can be used to access the current ISO 3166-2 codes of each country, and comprises three columns: [2] Entry: ISO 3166-1 alpha-2 code, click to view the ISO 3166-Maintenance Agency (ISO 3166-Maintenance Ag

Browsing Platform Retrieved from "Geocoding video tutorial: geocoding and the geocod
Geocoding API change log, yesterday we began adding ISO 3166-2 codes to the components portion of each result. (If such a code or codes exists for the location, and if the underlying data sources we rely on enable the determination of the correct codes(s). ISO 3166-2 codes identify the subdivisions of a country, and adding them was a request we've
had several times over the years. We hope adding these codes help developers cross link geocoding results with other datasets they may have. Here's an example from the response for an API request for coordinates 52.3877830, 9.7334394 - OpenCage's registered office. You can see the components now include a list with one item DE-NI which
corresponds to the German Bundesland (state) of Niedersachsen. An immediate question is why we return a list rather than just the value. Well, as always in geospatial there are a few edge cases that developers might not anticipate: First of all, a location can have more than one ISO 3166-2 code. Some countries (examples include the UK, France and
Spain) have multiple levels of ISO 3166-2 codes. Here's an example for coordinates 41.38455,2.16578 in Barcelona (and site of the upcoming Geomob Barcelona (and site of the upcoming Geomob Barcelona on 21st of June). As you can see, we return two ISO 3166-2 codes: ES-CT for the autonomous community of Catalonia, and ES-B for the province of Barcelona. Secondly, many countries,
particularly smaller countries, don't have ISO 3166-2 codes at all. Here's an example response from a request for the coordinates 41.90222,12.45724 (the location of the Vatican Obelisk at the center of St. Peter's Square in the Vatican. Likewise areas like the oceans that do not belong to any country, will not have an ISO 3166-2 code. Many countries
use abbreviations for their codes, but many also use numeric codes. Or both. Here's an example response from a request for the coordinates 48.85647,2.34081 - Pont Neuf in the center of Paris, France. Finally, be aware that there are many dependent territories that for historical reasons have their own ISO 3166-1 code, but have a different country
prefix in their ISO 3166-2 code. A good example is Puerto Rico. You can see the ISO 3166-1 alpha2 code is PR, but the ISO 3166-2 code is US-PR because Puerto Rico is part of the United States. As always please send us your feedback, about this new feature or any others you might like us to add. Happy geocoding, and warm greetings from
OpenCage HQ in DE-NI, Ed
